The New York Academy of Sciences has named the skull pictured above, known as the Würm Femur, as the most complete human skull discovered in the Americas. The femur bone, which links the femur (thigh) to the pelvis (hip) in the body, measures 13.4 centimeters (5.1 inches) long and is roughly the size of an average human thumb. Dating back 10,000 to 15,000 years, the femur was found near the small town of Loma Linda, California. The remains were discovered in 1978 by Jack Hood, founder of the Loma Linda Archaeological Center, while he was doing construction work. At the time, the area was known for its historical and Native American heritage, as well as for Loma Linda University, which is the first medical school in the western U.S. The skull is one of 11 complete human crania discovered at the site, which is a well-preserved, dry lake bed. The site is about 80 miles east of the Pacific Ocean, near the Loma Prieta Fault, a rupture in the Earth's crust that created the San Andreas Fault. Researchers have been analyzing the remains of other individuals and comparing the skeletons to DNA samples to see if they were related. The site may have been a cemetery for a settlement or community. Loma Linda University is currently organizing the Würm Collection, which includes bones and other artifacts dating back 10,000 to 30,000 years, as well as a skeletal assemblage of 200 individuals. The collection is a testament to the discovery's potential significance to the global population, as well as the importance of the area to Native Americans. "These remains are the oldest and largest collection of human skeletal remains found in North America," said Dr. Peter Barclay, the scientific director of the Würm Collection. "It is amazing to think that with this one discovery archaeologists were able to unravel the history of our
